

Plugfest summary 2024 - Noura

- JSON-LD Context issues need to be prioritized - makes sense to do a joint session with JSON-LD WG (test cases to identify issues)
- KNX IoT devices – sleep time, connection problem (!*maybe*) additional vocabulary is required for such devices
- Problems with the payload in the message for integration – still manual effort was required to adjust
- WoT servients behave different with the same TD – could read OPC UA properties with Siemens WoT servient, but write was not possible. TD adaption required
- Switching between networks was time consuming
